1 Introduction

1.1 Purpose

This document specifies the requirements for the Nepali Lifestyle Based Diet and Fitness Advisory System. It is intended for the development team, system architects, supervisors, and external evaluators. This Software Requirements Specification (SRS) serves as the baseline for the system's design, implementation, testing, and eventual deployment.

1.2 Scope

The Nepali Lifestyle Based Diet and Fitness Advisory System is a mobile and web-based application designed to provide customized dietary and fitness recommendations tailored to individual user profiles, health goals, and local Nepali culinary habits. The system will enable users to register, set up health and cultural profiles, upload photographs of their meals, receive automated nutritional analyses via machine learning, and obtain personalized meal and exercise suggestions. In-scope functionalities include image-based food detection using YOLO-based models, database matching with a semantic vector layer for local food names, calorie/macronutrient counting, health screening for medical conflicts, and structured AI response generation. Out of scope: medical diagnosis, clinical treatment protocols, direct e-commerce food delivery integration, and wearable hardware development.

1.3 Definitions, Acronyms, and Abbreviations

SRS	Software Requirements Specification
LLM	Large Language Model
YOLO	You Only Look Once (Object detection framework)
RDBMS	Relational Database Management System (e.g., PostgreSQL)
FR / NFR	Functional / Non-functional Requirement
GDM	Gestational Diabetes Mellitus
BMD	Bone Mineral Density

1.4 Overview of the Document

This document is organized into eight major sections. Section 1 introduces the system, defining its purpose, scope, and key terms. Section 2 lists the key objectives of the software development process. Section 3 analyzes the project domain, discussing the existing systems, their challenges, and the proposed solution. Section 4 presents the chosen Software Process Model (Waterfall) and its justification. Section 5 outlines the overall description of the product including its functions, user characteristics, key entities, constraints, and assumptions. Section 6 provides specific requirements, detailing user interfaces, functional requirements, and non-functional requirements. Section 7 presents the conclusion, followed by references in Section 8.

2 Objectives

Aim: To elicit the requirements of the chosen system and document them as a Software Requirements Specification using the IEEE 830 template.

Tools used: L^AT_EX for the document.

3 Project Domain Analysis

3.1 Domain Description

The domain of diet and fitness advisory systems covers tracking personal biometrics, logging physical activity, assessing caloric intake, and generating customized recommendations to promote health and well-being. In Nepal, this domain must uniquely reflect regional eating patterns, traditional cuisines (e.g., Dal, Bhat, Dhido, Gundruk), and cultural or religious fasting patterns (such as Brat, Ekadashi). Typical operations involve user health profiling, meal logging, food image processing for portion estimation, semantic matching of colloquial terms to nutritional tables, and generation of customized lifestyle advice.

3.2 Existing System Overview

Existing nutritional and fitness systems are primarily international applications developed around Western dietary datasets. They lack information on local Nepali ingredients, traditional recipes, and regional portion sizes. Some experimental local systems exist, but they are either human-expert consultation platforms that do not scale or rely on computationally heavy models (such as Mask R-CNN) with long inference latency, making them impractical for standard web or mobile interfaces.

3.3 Problems in Existing System

The existing methods of tracking and advising on diet and fitness in Nepal present several challenges:

- **Lack of Nepali Food Data:** Western databases ignore traditional ingredients, making caloric and nutrient tracking inaccurate for Nepali users.
- **Neglect of Cultural/Religious Constraints:** Standard systems fail to account for religious fasting cycles, strict vegetarian constraints during specific festivals, or local food-combining taboos.
- **Poor Scalability:** Existing clinical platforms in local hospitals require manual consultations with experts, creating a bottleneck for user access.
- **Computational Inefficiency:** Computer vision tools developed for local food segmentation suffer from high computational overhead and long latency, hindering real-time usage.
- **Low User Retention:** Generic advice that does not align with the local lifestyle leads to high attrition rates and low user engagement.
- **Data Privacy Issues:** Existing digital fitness trackers often lack strict protocols to ensure ethical processing of sensitive user metrics.

3.4 Proposed System

The proposed Nepali Lifestyle Based Diet and Fitness Advisory System is a responsive application utilizing a dual-database layer (PostgreSQL and ChromaDB) and lightweight AI models. The system features a custom YOLO-based instance segmentation model trained on Nepali cuisines for food detection, and utilizes cosine similarity in vector space to map local everyday food names to official databases. Recommendations are dynamically generated through a structured LLM backend that adheres to health metrics and cultural constraints.

4 Software Process Model

4.1 Waterfall Model

The Waterfall model is chosen for this project. Development follows a sequential progression: Requirements → Design → Implementation → Testing → Deployment → Maintenance.

4.2 Process Model Diagram

Requirements Analysis → System Design → Implementation → Testing →
Deployment → Maintenance

4.3 Phases of the Model

1. **Requirements analysis:** Elicitation and formalization of functional and non-functional requirements resulting in this SRS document.
2. **System design:** Structuring the application architecture, database schemas (relational and vector), and designing the UI and ML interfaces.
3. **Implementation:** Development of the React frontend, Django/FastAPI backend, custom YOLO model integration, and vector search setup.
4. **Testing:** Executing unit, integration, and user acceptance tests to verify food item segmentation, name matching accuracy, and recommendation correctness.
5. **Deployment:** Hosting the frontend on Vercel and the backend on Render or Railway, making the app accessible to public users.
6. **Maintenance:** Providing updates, bug fixes, database expansions, and fine-tuning the recommendation generation.

4.4 Justification

- The core workflow of a personal dietary advisory application is stable and well-defined (profile → input → analyze → recommend).
- The project tasks (UI development, database matching, machine learning integration) are highly sequential, allowing clean phase transitions.
- A clear baseline at each stage (SRS, design files, test logs) helps the development team maintain quality constraints.
- The model fits well within the academic project timeline, ensuring structured reviews by mentors.

5 Overall Description

5.1 Product Perspective

The Nepali Lifestyle Based Diet and Fitness Advisory System is a standalone personal health assistant. It consists of a web/mobile frontend that communicates with a FastAPI and Django-based backend. The backend manages a relational database (PostgreSQL) for user data and a vector database (ChromaDB) for semantic food mapping. The system connects to standard external services for optional local LLM parsing or runs with quantized local models.

5.2 Product Functions

- **Profile Management:** Register and capture user health profiles, dietary habits, and cultural constraints.
- **Meal Logging:** Record daily meals manually or through image uploads.
- **Food Image Upload:** Allow plate photograph upload for automatic visual analysis.
- **Nutritional Analysis:** Segment food items from photos, estimate portion sizes, and calculate caloric/macronutrient values.
- **Personalized Advisory:** Generate customized diet and fitness recommendations based on user profiles.
- **Progress Tracking:** Visualize historical logs of nutrition, weight, and fitness targets.

5.3 User Characteristics

- **General User (Patron):** Individual seeking health tracking; logs meals, views recommendations, and interacts with the dashboard.
- **System Administrator:** Manages database updates, resolves system issues, monitors performance, and updates machine learning datasets.

5.4 Key Entities

- **User Profile:** User ID, name, age, weight, height, activity level, medical restrictions, religious constraints.
- **Food Item:** Item ID, local name, scientific name, portion size, calories, proteins, fats, carbohydrates.
- **Meal Log:** Log ID, user ID, timestamp, meal type, image path, detected items, portion multipliers, total nutrients.
- **Recommendation Plan:** Plan ID, user ID, date, target calories, meal plan, suggested physical exercises.

5.5 Constraints

- The backend API must be optimized to run food item detection within small latency windows.
- User health data must be secured, with password hashing enforced.
- The application layout must be mobile-responsive to cater to users logging meals on standard smartphones.

5.6 Assumptions and Dependencies

- Users have a mobile device or PC with stable internet connectivity and a working camera.
- Nutritional data sourced from reference materials (e.g., Santosh Khatiwada, AMITPANT7) is accurate and sufficient for standard regional cuisines.

6 Specific Requirements

6.1 External Interface Requirements

6.1.1 User Interfaces

A mobile-first browser interface featuring a dashboard, user profile page, meal log/image upload section, nutritional analysis report, and a workout plan schedule.

6.1.2 Hardware Interfaces

Standard web server infrastructure and mobile camera hardware for capturing plate photographs.

6.1.3 Software Interfaces

React frontend, Django and FastAPI backend runtime, PostgreSQL for relational user logs, and ChromaDB for vector-based semantic mapping.

6.1.4 Communication Interfaces

HTTPS protocol for secure client-server communication.

6.2 Functional Requirements

ID	Functional Requirement	Priority
FR-1	The system shall allow users to register and manage their profile details including age, weight, height, activity level, medical conditions, and cultural/religious constraints.	High
FR-2	The system shall allow users to log their daily meals manually by entering text descriptions or food names.	High
FR-3	The system shall allow users to upload food plate images through their device camera or gallery.	High
FR-4	The system shall automatically detect and segment individual food items in uploaded images using a YOLO instance segmentation model.	High
FR-5	The system shall map local/colloquial food names (e.g., "bhat") to official database records using semantic cosine similarity in a vector database.	High
FR-6	The system shall analyze the portion sizes and calculate the total calories and macronutrients of logged meals.	High
FR-7	The system shall generate personalized daily diet recommendations based on user profiles, medical conditions, and religious fasting constraints.	Medium
FR-8	The system shall provide personalized daily fitness/exercise recommendations tailored to the user's physical condition and goals.	Medium
FR-9	The system shall track and display user progress over time, including weight changes, caloric trends, and nutrient compliance.	Medium
FR-10	The system shall enforce safety screening by warning users or filtering out food recommendations that conflict with their medical conditions.	High

6.3 Non-functional Requirements

ID	Non-functional Requirement	Category
NFR-1	The system shall process food plate images and return segmented objects within 3 seconds.	Performance
NFR-2	The system shall encrypt all user data in transit using TLS/HTTPS, and store user passwords as salted cryptographic hashes.	Security
NFR-3	The system shall be available with 99.5% uptime, providing offline meal-logging queues when connection is temporarily lost.	Reliability
NFR-4	The user interface must be fully responsive, scaling properly down to 360px width without horizontal scrolling.	Usability
NFR-5	The backend codebase shall maintain at least 80% unit test coverage and separate API, business, and ML layers to facilitate maintenance.	Maintainability

6.4 Other Requirements

- The local database of regional dishes and ingredients must be updated monthly to include new verified items.
- The system shall support Romanized Nepali query terms (e.g., "gundruk", "bhat", "dal") for ease of searching.

7 Conclusion

In this lab, the team successfully elicited and documented the requirements of the Nepali Lifestyle Based Diet and Fitness Advisory System using the IEEE 830 template. The functional requirements, including user registration, food image upload, semantic food name matching, nutritional analysis, and personalized diet/fitness recommendations, were clearly defined alongside critical non-functional parameters. These structured specifications establish a traceable baseline for subsequent architectural design and software testing phases.
